# Map Reduce program to process a weather dataset.

#### Aim:

To implement MapReduce program to process a weather dataset

## **Procedure:**

### **Step 1: Create Data File:**

Create a file named "word\_count\_data.txt" and populate it with text data that you wish to analyse.

Login with your hadoop user.

| Download the dataset (weather data) |       |        |       |      |      |      |      |      |         |      |      |      |       |     |
|-------------------------------------|-------|--------|-------|------|------|------|------|------|---------|------|------|------|-------|-----|
| Output:                             | d     |        |       |      |      |      |      |      |         |      |      | _    |       | ×   |

| 23907 20150126                      | 2 423 | -98 A8 | 30 62 | 21 5 | 7 )  | 14 4 | 14 1 | a a  | 12 A1 C | 22 9 | 5.5  | 12 2 | 56.8  | , ' |
| <                                   |       |        |       |      |      |      |      |      |         |      |      |      |       | >   |

**Step 2: Mapper Logic - mapper.py:** 

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

```
nano mapper.py
# Copy and paste the mapper.py code
```

#!/usr/bin/env python

import sys

# input comes from STDIN (standard input)

# the mapper will get daily max temperature and group it by month. so output will be (month,dailymax\_temperature)

```
for line in sys.stdin:
  # remove leading and trailing whitespace
  line = line.strip()
  # split the line into words
  words = line.split()
  #See the README hosted on the weather website which help us understand how each
position represents a column
  month = line[10:12]
  daily max = line[38:45]
  daily_max = daily_max.strip()
  # increase counters
  for word in words:
    # write the results to STDOUT (standard output);
    # what we output here will be go through the shuffle proess and then
    # be the input for the Reduce step, i.e. the input for reducer.py
    # tab-delimited; month and daily max temperature as output
    print ('%s\t%s' % (month ,daily_max))
```

# **Step 3: Reducer Logic - reducer.py:**

Create a file named "reducer.py" to implement the logic for the reducer. The reducer will aggregate the occurrences of each word and generate the final output.

```
nano reducer.py
# Conv and paste the reducer by code
```

for line in sys.stdin:

```
reducer.py
#!/usr/bin/env python
 from operator import itemgetter
 import sys
 #reducer will get the input from stdid which will be a collection of key, value(Key=month,
 value= daily max temperature)
 #reducer logic: will get all the daily max temperature for a month and find max temperature
 for the month
 #shuffle will ensure that key are sorted(month)
 current\_month = None
 current max = 0
 month = None
 # input comes from STDIN
```

```
# remove leading and trailing whitespace
  line = line.strip()
  # parse the input we got from mapper.py
  month, daily_max = line.split('\t', 1)
  # convert daily max (currently a string) to float
    daily_max = float(daily_max)
  except ValueError:
     # daily_max was not a number, so silently
    # ignore/discard this line
     continue
  # this IF-switch only works because Hadoop shuffle process sorts map output
  # by key (here: month) before it is passed to the reducer
  if current_month == month:
     if daily_max > current_max:
       current_max = daily_max
  else:
     if current_month:
       # write result to STDOUT
       print ('%s\t%s' % (current_month, current_max))
     current_max = daily_max
     current month = month
# output of the last month
if current_month == month:
  print ('%s\t%s' % (current_month, current_max))
```

#### **Step 4: Prepare Hadoop Environment:**

Start the Hadoop daemons and create a directory in HDFS to store your data.

```
start-all.sh
```

# **Step 6: Make Python Files Executable:**

Give executable permissions to your mapper.py and reducer.py files.

```
chmod 777 mapper.py reducer.py
```

# **Step 7: Run the program using Hadoop Streaming:**

Download the latest hadoop-streaming jar file and place it in a location you can easily access.

Then run the program using

Hadoop Streaming.hadoop fs -

mkdir -p /weatherdata

hadoop fs -copyFromLocal

/home/sx/Downloads/dataset.txt /weatherdatahdfs

dfs -ls /weatherdata

hadoop jar /home/sx/hadoop-3.2.3/share/hadoop/tools/lib/hadoop-streaming-3.2.3.jar  $\setminus$ 

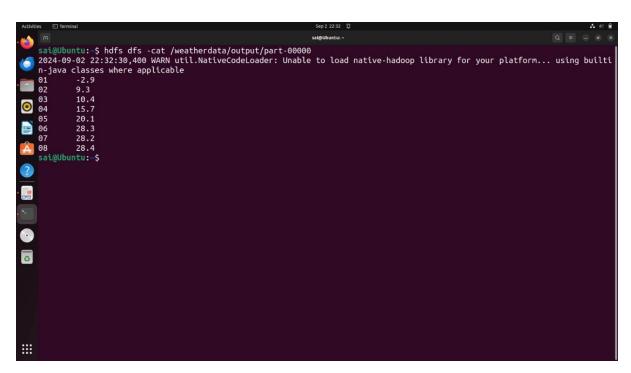

- -input /weatherdata/dataset.txt \
- -output /weatherdata/output \
- -file "/home/sx/Downloads/mapper.py" \
- -mapper "python3 mapper.py" \
- -file "/home/sx/Downloads/reducer.py" \
- -reducer "python3 reducer.py"

hdfs dfs -text /weatherdata/output/\* > /home/sx/Downloads/outputfile.txt

# **Step 8: Check Output:**

Check the output of the program in the specified HDFS output directory.

# **OUTPUT:**

# **Result:**

Thus, the program for weather dataset using Map Reduce has been executed successfully.
